Re: Switching an In-Flight CSV Project to CSA

Basis: analysis-20261002T111530Z.md · Report · All files

Band (from §6): MEDIUM

Derived from §6 and the structured summary of analysis-20261002T111530Z.md; the six sections remain the source of truth.

In brief: The analysis separates the fears about a switch that it retires from the project facts that remain unverified (C1, §3).

It retires the belief that CSA is a lower compliance bar (A-2, C1), that switching invalidates executed scripted tests (A-3, C2), and that a mixed scripted and unscripted package is inherently non-compliant (A-9).

Four ground truths are unverified: the SOP and plan state (GT-9?), the not-high-risk share of remaining scope (GT-10?), the ISO 13485 procedure wording (GT-11?) and whether the system sits inside the guidance's scope (GT-13?).

The SOP constraint expires once the SOP is revised and the plan amended (A-4), and if the SOP is already revised the procedure gate is already open (A-19, C3). A system outside the guidance's scope would take the guidance out of play (A-5, GT-13?).

The analysis flags self-inflicted procedural nonconformance, process-risk misclassification and box-ticking execution among the twelve risks in its register, each with a named control (C7).
