

Decision Owner view — Switching an In-Flight CSV Project to CSA

Derived from §6 and the structured summary of analysis-20261002T111530Z.md; the six sections remain the source of truth.

Band (from §6): MEDIUM

- **What was examined, and why does it matter?** The analysis examined whether changing validation method part-way through one in-flight FDA-regulated project costs or risks more than it saves (§1).
- **What has it settled that I can rely on?** Executed scripted evidence carries over and needs a risk mapping, not re-execution (C2). Under CSA, rigor shifts toward safety-relevant features under a Part 11 evidence floor rather than falling everywhere (C8).
- **How sure is it, and what is it unsure about?** The analysis rates its conclusion MEDIUM (§6). It turns on three unread facts: the firm's SOP state (GT-9?), the not-high-risk share of remaining work (GT-10?) and whether the system sits inside the guidance's scope (GT-13?).
- **Where do I find the recommendation?** The Answer block and §6 state it as a default with a conditional switch (C5). That switch depends on the SOP permitting risk-based assurance, a prior plan amendment, and a net saving under the $R \times f \times r$ versus B rule (C3, C4).
