

Risk view — Switching an In-Flight CSV Project to CSA

Derived from §6 and the structured summary of analysis-20261002T111530Z.md; the six sections remain the source of truth.

Band (from §6): MEDIUM

Four ground truths were not read at source (§3):

- The SOP and approved plan prescribing scripted CSV is unverified (GT-9?).
- The not-high-risk share of remaining work is unknown (GT-10?).
- The ISO 13485 documented-procedure wording was not opened (GT-11?).
- Whether the system is inside the CSA guidance's scope is unconfirmed (GT-13?).

What could change: the SOP constraint expires once the SOP is revised and the plan amended (A-4). The savings estimates of 50–80% per feature and 10–40 person-days of switch cost are untested beliefs (A-16, A-17). Team competence in unscripted testing is unverified (A-7). The §6 Pre-check reports an inputs ceiling of MEDIUM (§6). The main cautions the analysis flags are executing CSA before the procedure permits it, misclassifying a safety-relevant feature, and applying the guidance outside its scope (C7). Finishing under CSV carries its own risk of box-ticking execution by an overruled team (C6).
