Re: Switching an In-Flight CSV Project to CSA

Basis: analysis-20261002T111530Z.md

Band (from §6): MEDIUM

Derived from §6 and the structured summary of analysis-20261002T111530Z.md; the six sections remain the source of truth.

In brief: The analysis sets out which method governs the remaining, unexecuted validation work and what must be in place before any of it changes (C5, C3).

By default the remaining work continues under the approved CSV plan, and the Answer block and §6 state when the unexecuted remainder would move to CSA instead (C5). Executed scripted tests are kept and mapped to a risk determination rather than re-run (C2).

The firm's documented validation procedure binds until a regulation change (A-10), and Part 11 applies to electronic validation evidence on the same terms (A-12).

An immediate full re-plan scored 53 against 78 and pays re-planning cost on work that already carries over (§5, C5). A pause-then-switch scored 67 and adds a schedule stop without evidence advantage (§5).

Three facts remain unverified: whether the SOP and plan permit risk-based assurance (GT-9?), the not-high-risk share of remaining tests (GT-10?), and whether the system is inside the guidance's scope (GT-13?).
